

Informal Intergovernmental Relations in Land Administration Systems

*Christian Clausen
M.Sc., PhD-student
Aalborg University & the National
Survey and Cadastre, Denmark*

The trigger

- e - Title registration system in Denmark
- Representatives from the Danish cadastre and the Danish land book
- Different visions, do not speak the same “language”, technical point of view vs. legal point of view
→ hard to develop new system

A theoretical angle

- Constraints are the term used when referring to the rules that shape human interaction

Douglas North 1990

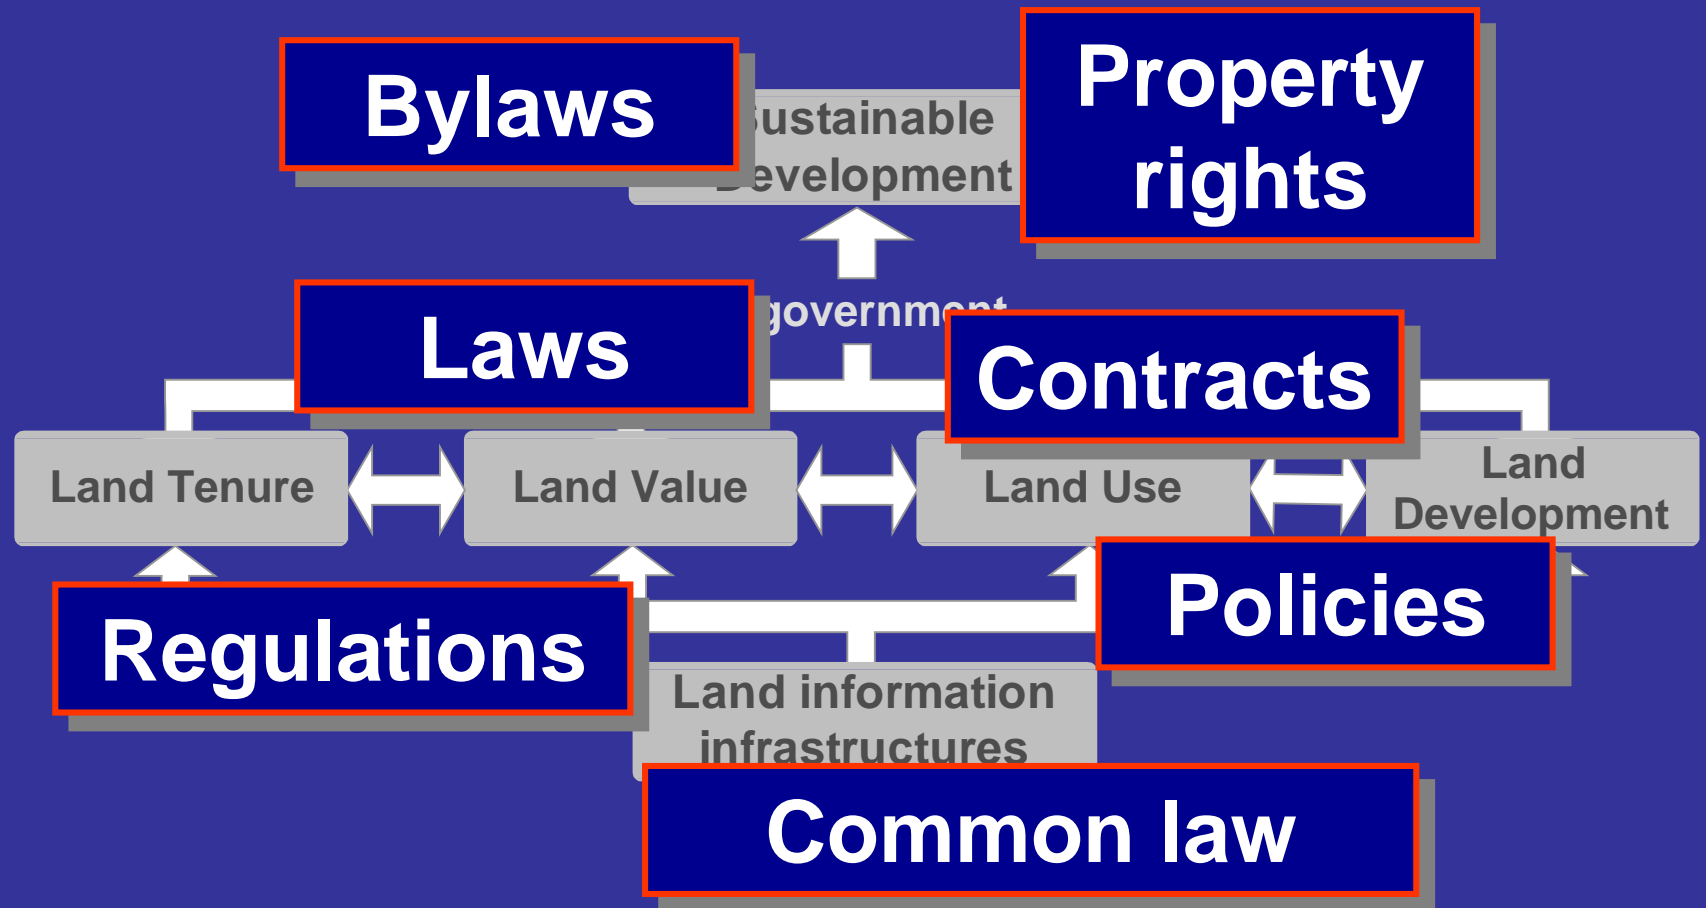

- Constraints can both be formal and informal
- Rules are prescriptions that forbid, permit, or require some action or outcome and authorize sanctions if the rules are not followed

Elinor Ostrom 1994

Formal vs. informal constraints

- Formal constraints are written rules
 - Political (and legal rules), economic rules, and contracts

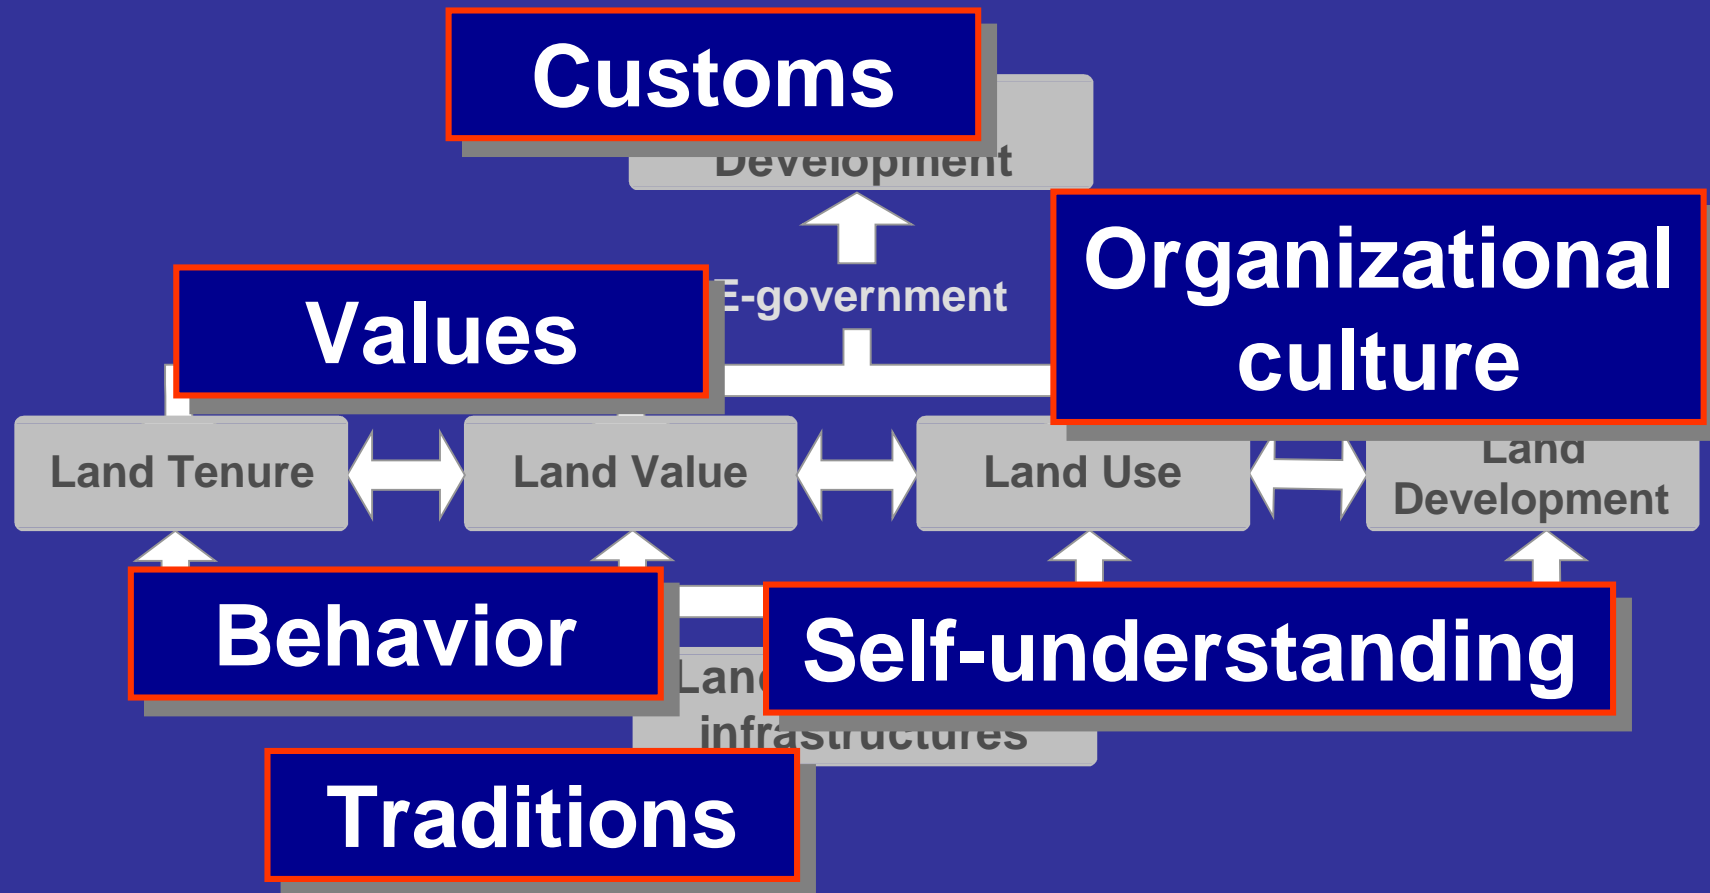

Formal constraints

Formal vs. informal constraints

- Informal constraints are the “rest”
 - Codes of conduct, norms of behavior and conventions

Informal constraints

Focus on formal constraints

Overall research question

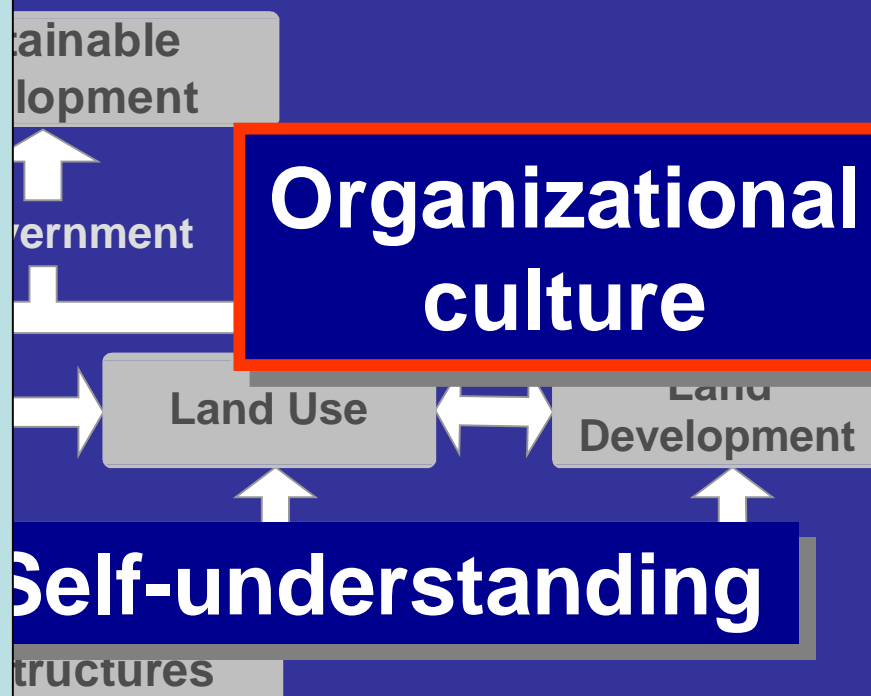

- Are informal constraints important to the administrative function of land administration systems? (How and why?)
- How can the structure of informal constraints in land administration systems supplement the existing understanding of the overall land management paradigm?

Land administration system

- Informal constraints

How do differences in organizational culture in the administrative institutions affect the functions of the system?

(Danish example)

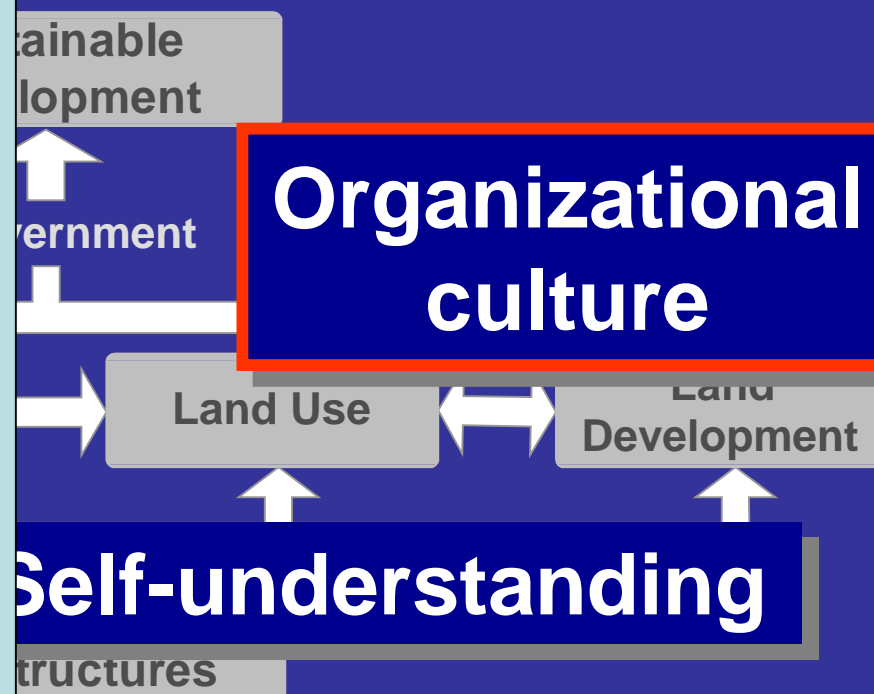

Land administration system

- Informal constraints

How do we define organizational culture in the land administration systems?

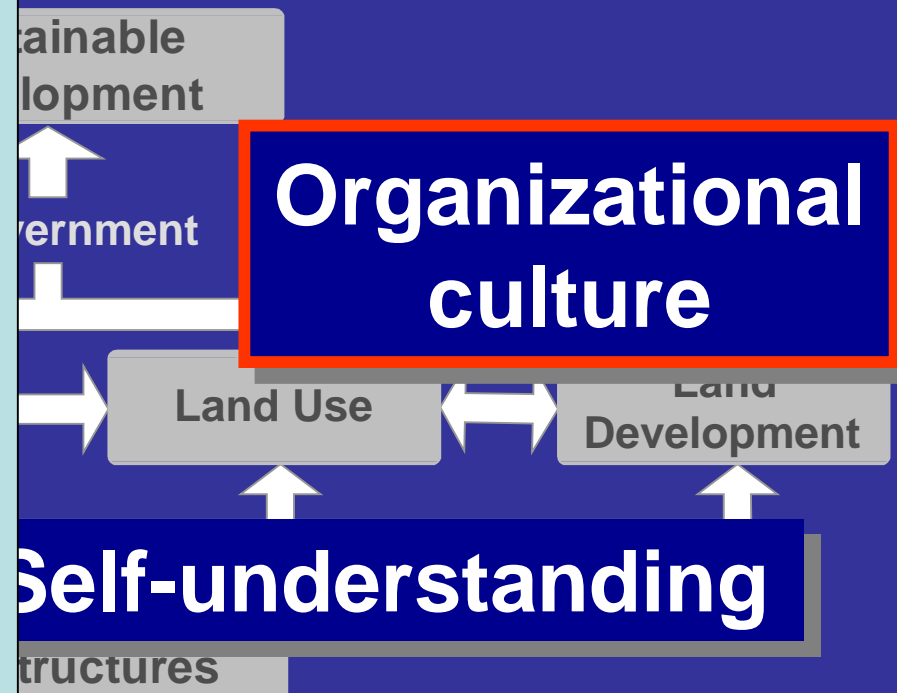

Is this different from organizational culture in other administrative systems?

Land administration system

- Informal constraints

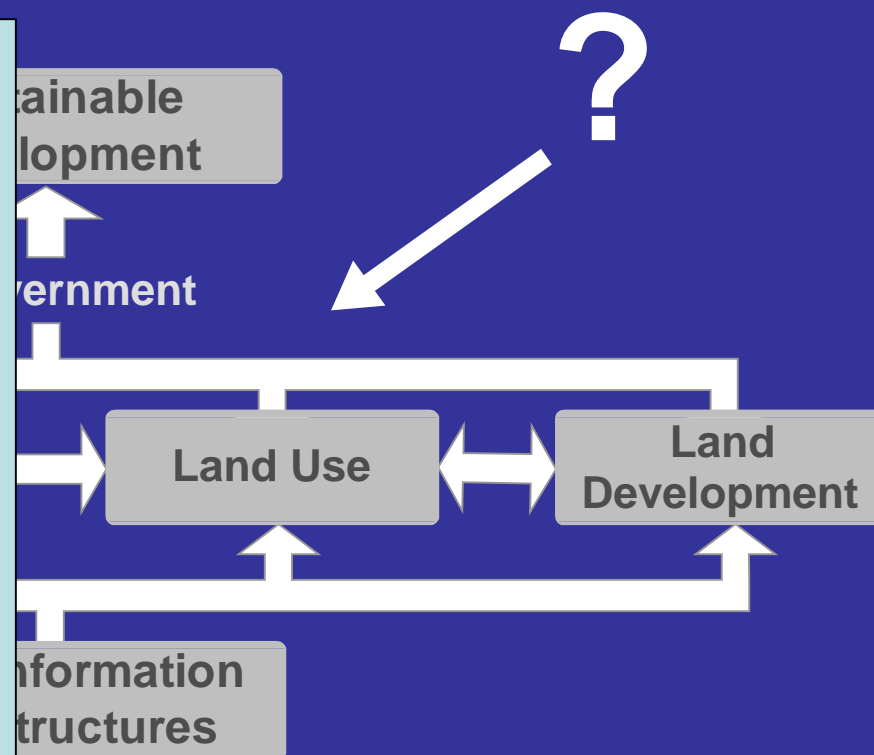

How can organizational culture be a barrier to the functions of a land administration system?

Land administration system

- Informal constraints

How do informal constraints fit into the exiting understanding of the functions, components and infrastructures of a land administration system?

Why is this interesting?

Fiscal/juridical

Land transfer

Planning

Multipurpose

**Land information
networks**

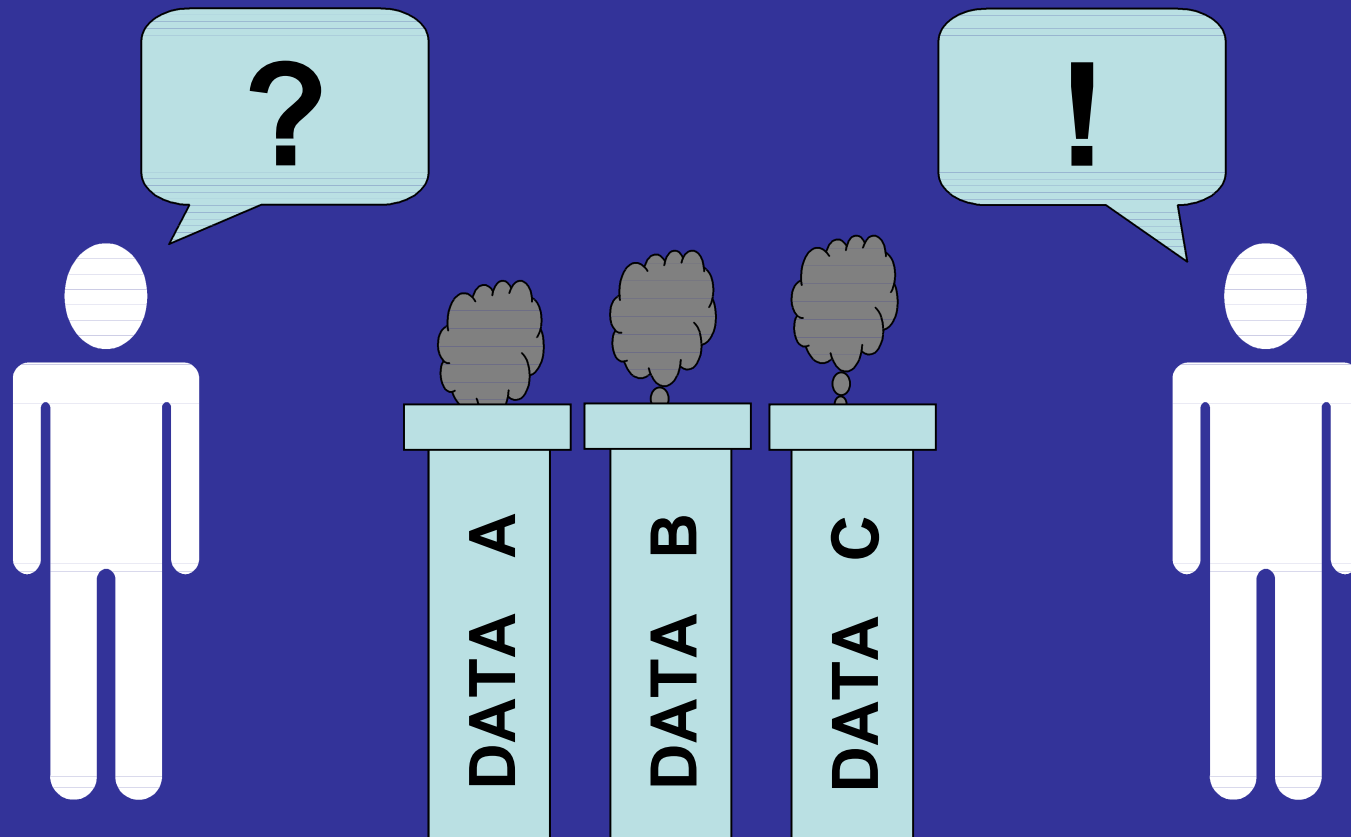

E-governance

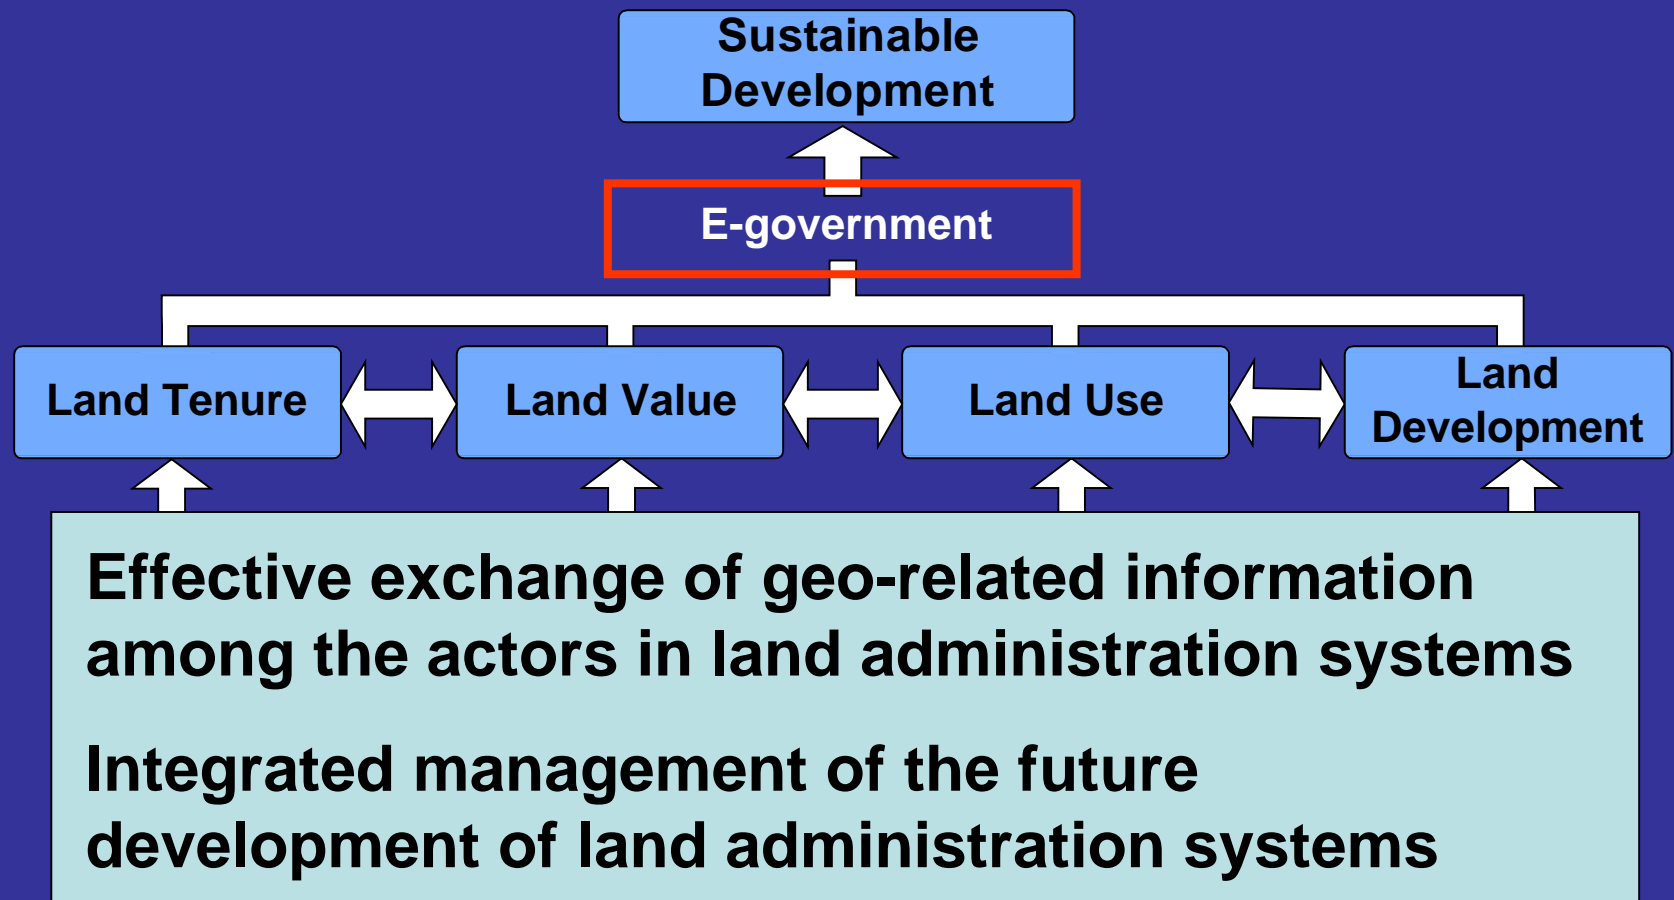

Advanced cooperation

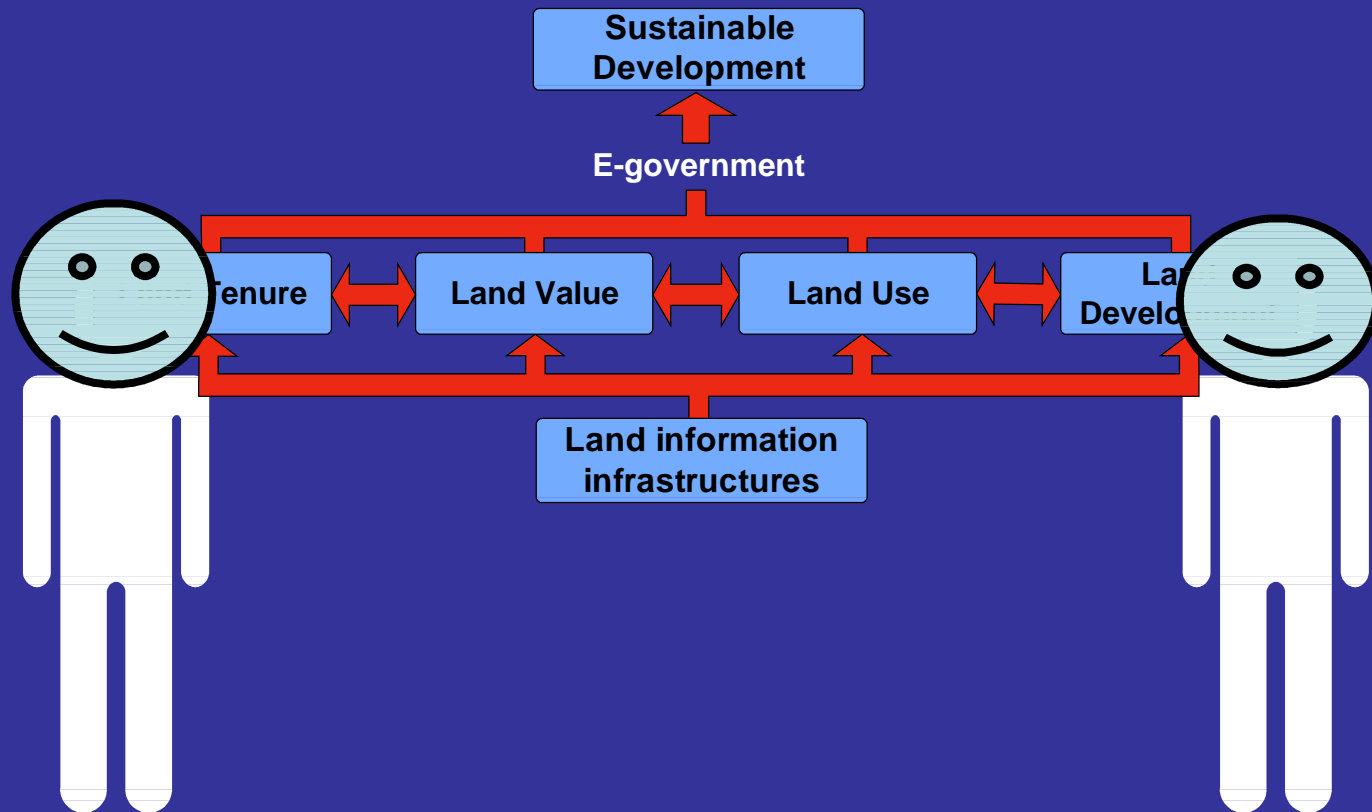

Abandon the isolated “stovepipes” of data

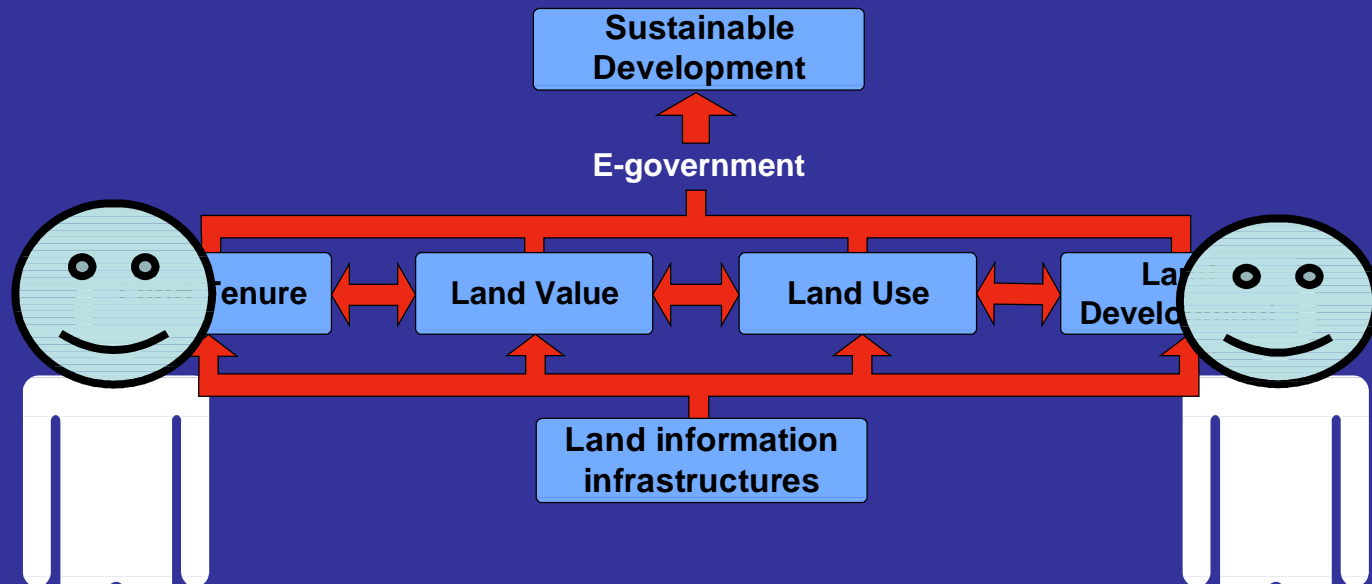

E-governance foster large extend of cooperation

Build cooperation through understanding

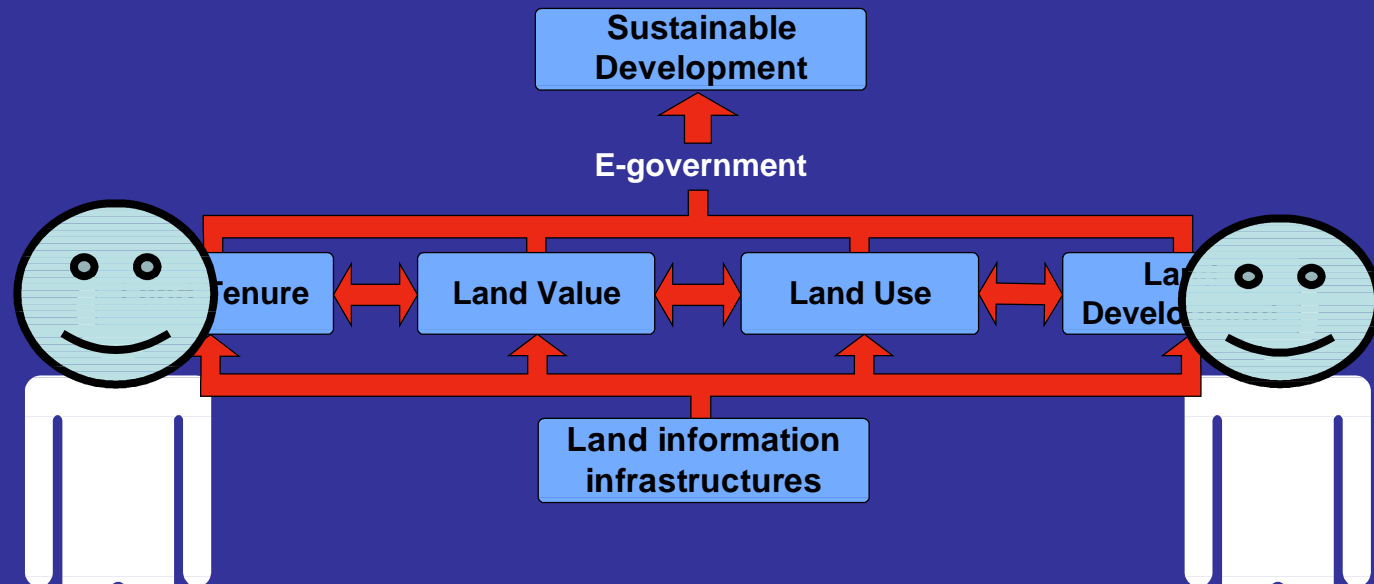

Build cooperation through understanding

**In a cooperative system
formal rules are important**

Build cooperation through understanding

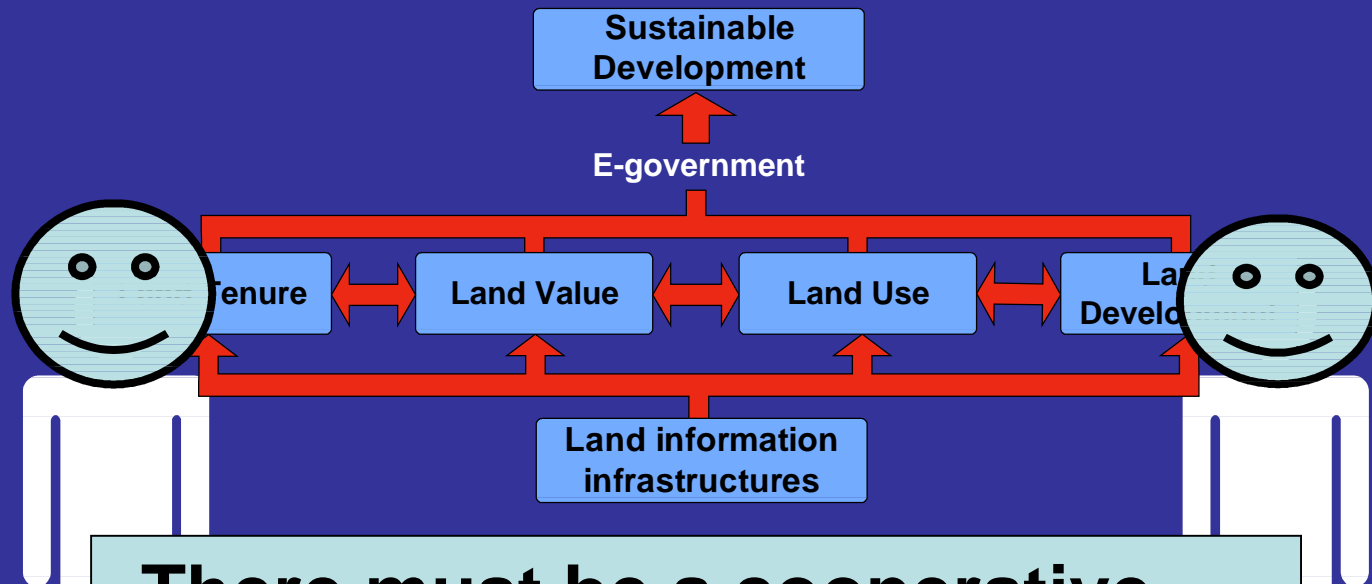

The legislation, regulations and contracts must be efficient, consistent and contribute to cooperation

Build cooperation through understanding

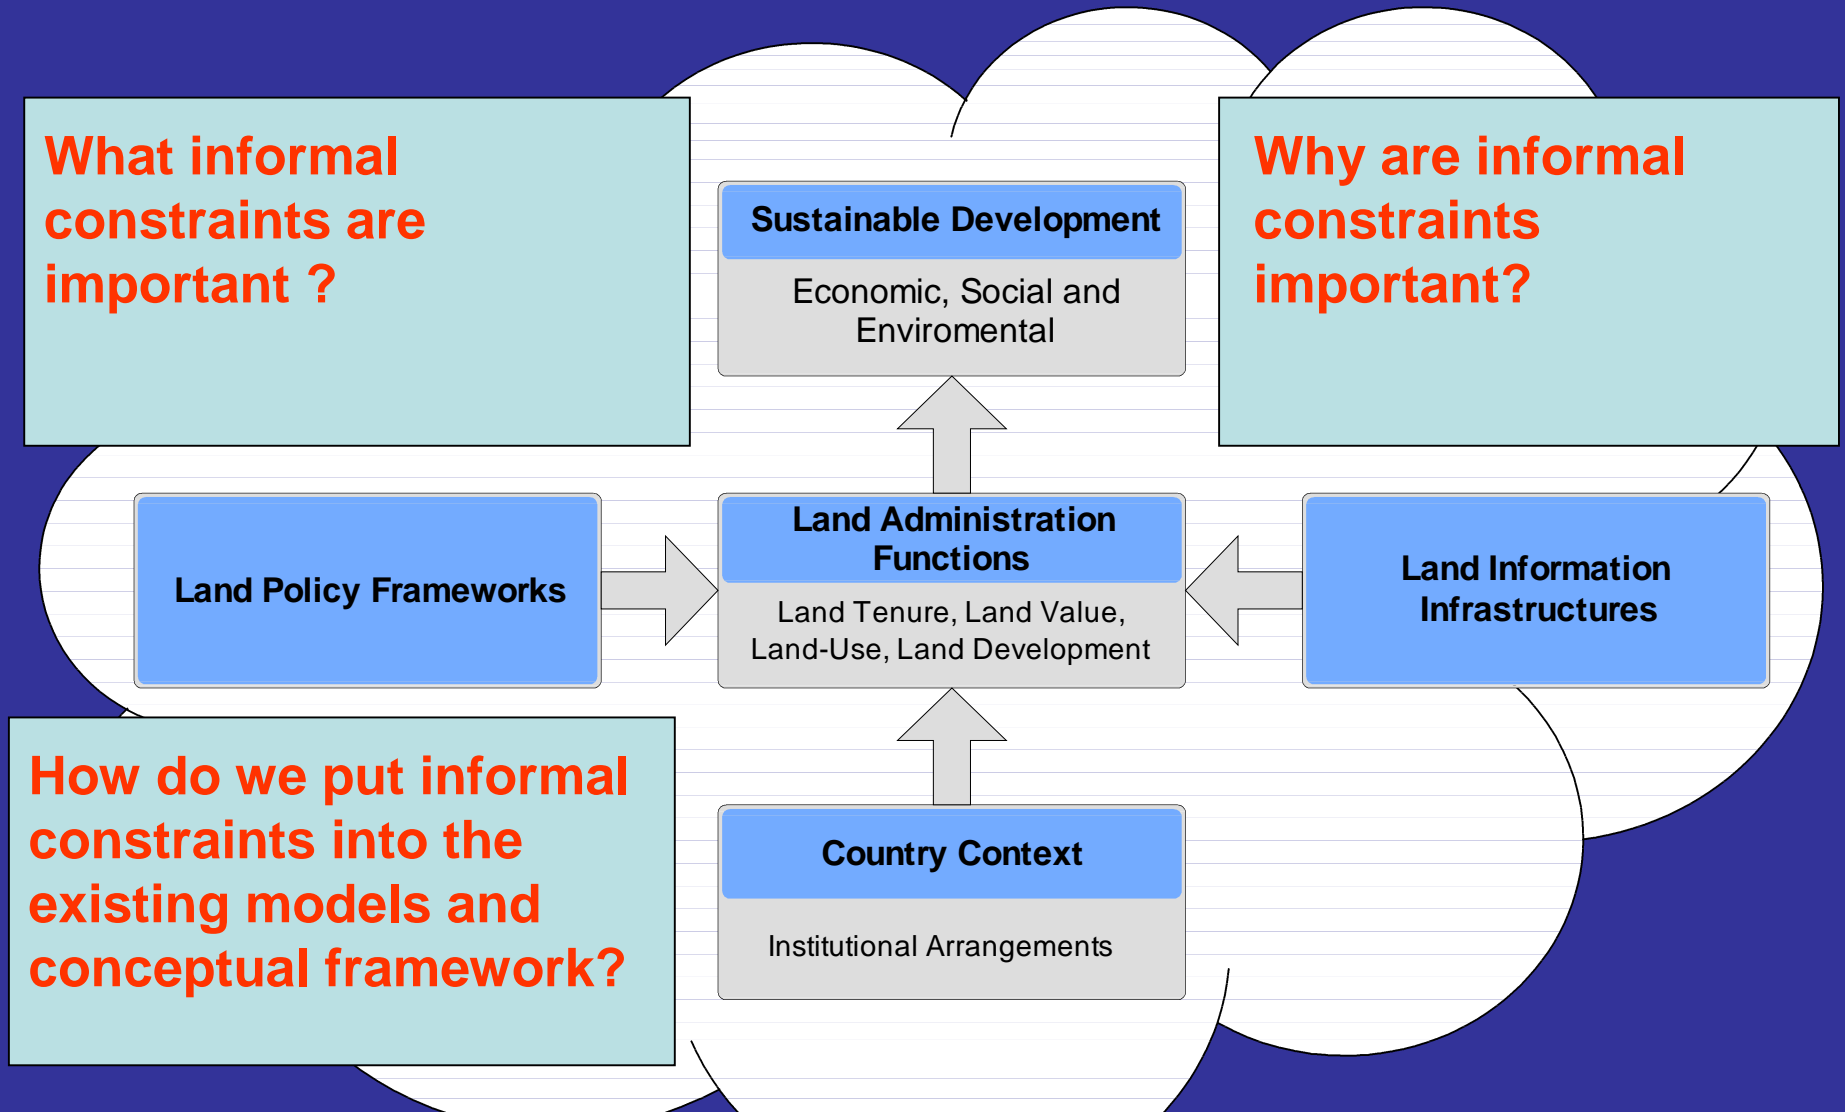

My hypothesis is that this is not enough!

Build cooperation through understanding

There must be a cooperative culture in the system, the different institutions must share the same overall vision and “speak the same language”

Focus on informal constraints is a supplement to the existing understanding

Thank you
